In its infancy, the movement to protect wilderness areas in the United States was motivated less by perceived threats from industrial and agricultural activities than by concern over the impacts of automobile owners seeking recreational opportunities in wild areas. Countless commercial and government purveyors vigorously promoted the mystique of travel to breathtakingly scenic places, and roads and highways were built to facilitate such travel. By the early 1930s, New Deal public works programs brought these trends to a startling crescendo. The dilemma faced by stewards of the nation's public lands was how to protect the wild qualities of those places while accommodating, and often encouraging, automobile-based tourism. By 1935, the founders of the Wilderness Society had become convinced of the impossibility of doing both. In *Driven Wild*, Paul Sutter traces the intellectual and cultural roots of the modern wilderness movement from about 1910 through the 1930s, with tightly drawn portraits of four Wilderness Society founders--Aldo Leopold, Robert Sterling Yard, Benton MacKaye, and Bob Marshall. Each man brought a different background and perspective to the advocacy for wilderness preservation, yet each was spurred by a fear of what growing numbers of automobiles, aggressive road building, and the meteoric increase in Americans turning to nature for their leisure would do to the country's wild places. As Sutter discovered, the founders of the Wilderness Society were "driven wild"--pushed by a rapidly changing country to construct a new preservationist ideal. Sutter demonstrates that the birth of the movement to protect wilderness areas reflected a growing belief among an important group of conservationists that the modern forces of capitalism, industrialism, urbanism, and mass consumer culture were gradually eroding not just the ecology of North America, but crucial American values as well. For them, wilderness stood for something deeply sacred that was in danger of being lost, so that the movement to protect it was about saving not just wild nature, but ourselves as well.

When viewed from space, the Korean Peninsula is crossed by a thin green ribbon. On the ground, its mix of dense vegetation and cleared borderlands serves as home to dozens of species that are extinct or endangered elsewhere on the peninsula. This is Korea's demilitarized zone—one of the most dangerous places on earth for humans, and paradoxically one of the safest for wildlife. Although this zone was not intentionally created for conservation, across the globe hundreds of millions of acres of former military zones and bases are being converted to restoration areas, refuges, and conservation lands. David G. Havlick has traveled the world visiting these spaces of military-to-wildlife transition, and in *Bombs Away* he explores both the challenges—physical, historical, and cultural—and fascinating ecological possibilities of military site conversions. Looking at particular international sites of transition—from Indiana's Big Oaks National Wildlife Refuge to Cold War remnants along the former Iron Curtain—Havlick argues that these new frontiers of conservation must accomplish seemingly antithetical aims: rebuilding and protecting ecosystems, or restoring life, while also commemorating the historical and cultural legacies of warfare and militarization. Developing these ideas further, he shows that despite the ecological devastation often wrought by military testing and training, these activities need not be inconsistent with environmental goals, and in some cases can even complement them—a concept he calls ecological militarization. A profound, clear explication of landscapes both fraught and fecund, marked by death but also reservoirs of life, *Bombs Away* shows us how "military activities, conservation goals, and ecological restoration efforts are made to work together to create new kinds of places and new conceptions of place."

"Frightening...Firestorm comes alive when Struzik discusses the work of offbeat scientists." --New York Times Book Review
"Comprehensive and compelling." --Booklist "A powerful message." --Kirkus "Should be required reading." --Library Journal
In the spring of 2016, the world watched as wildfire ravaged the Canadian town of Fort McMurray. Firefighters named the fire "the Beast." It seemed to be alive with destructive energy, and they hoped never to see anything like it again. Yet it's not a stretch to imagine we will all soon live in a world in which fires like the Beast are commonplace. In *Firestorm*, Edward Struzik confronts this new reality, offering a deftly woven tale of science, economics, politics, and human determination. It's possible for us to flourish in the coming age of megafires—but it will take a radical new approach that requires acknowledging that fires are no longer avoidable. Living with fire also means, Struzik reveals, that we must better understand how the surprising, far-reaching impacts of these massive fires will linger long after the smoke eventually clears.

New parents and parents of toddlers face unique challenges when it comes to planning outdoor trips. "Family-friendly trail" is often a misleading phrase, and doesn't take young children under the age of 5 into consideration, whose safety and comfort require a different perspective. The unpredictable nature of little ones leads many parents to put their adventure dreams on the back burner, missing out on years of meaningful experiences as a family. *Hike it Baby* presents 100 outdoor adventures across the U.S. that you can take with babies and toddlers (really!), along with everything you need to know about exploring the natural world. Sourced from real families using *Hike it Baby's* trail-tested system, this book helps moms and dads get out there in their comfort zone, yet feel like hardcore adventurers! Whether you've always wanted to hike part of the Appalachian Trail, splash around in gentle Northwest waterfalls, or scramble up rocks in the desert surrounded by Joshua Trees, this book shows you how to plan a truly memorable journey together.

The Colorado River Basin's importance cannot be overstated. Its living river system supplies water to roughly forty million people, contains Grand Canyon National Park, Bears Ears National Monument, and wide swaths of other public lands, and encompasses ancestral homelands of twenty-nine Native American tribes. John Wesley Powell, a one-armed Civil War veteran, explorer, scientist, and adept federal administrator, articulated a vision for Euro-American colonization of the "Arid Region" that has indelibly shaped the basin—a pattern that looms large not only in western history, but also in contemporary environmental and social policy. One hundred and fifty years after Powell's epic 1869 Colorado River Exploring Expedition, this volume revisits Powell's vision, examining its historical character and its relative influence on the Colorado River Basin's cultural and physical landscape in modern times. In three parts, the volume unpacks Powell's ideas on water, public lands, and Native Americans—ideas at once innovative, complex, and contradictory. With an eye toward climate change and a host of related challenges facing the basin, the volume turns to the future, reflecting on how—if at all—Powell's legacy might inform our collective vision as we navigate a new "Great Unknown."

"Wonderfully written...Mr. Owen writes about water, but in these polarized times the lessons he shares spill into other arenas. The world of water rights and wrongs along the Colorado River offers hope for other problems." —Wall Street Journal
An eye-opening account of where our water comes from and where it all goes. The Colorado River is an essential resource for a surprisingly large part of the United States, and every gallon that flows down it is owned or claimed by someone. David Owen traces all that water from the Colorado's headwaters to its parched terminus, once a verdant wetland but now a million-acre desert. He takes readers on an adventure downriver, along a labyrinth of waterways, reservoirs, power plants, farms, fracking sites, ghost towns, and RV parks, to the spot near the U.S.–Mexico border where the river runs dry. Water problems in the western United States can seem tantalizingly easy to solve: just turn off the fountains at the Bellagio, stop selling hay to China, ban golf, cut down the almond trees, and kill all the lawyers. But a closer look reveals a vast man-made ecosystem that is far more complex and more interesting than the headlines let on. The story Owen tells in *Where the Water Goes* is crucial to our future: how a patchwork of engineering marvels, byzantine legal agreements, aging infrastructure, and neighborly cooperation enables life to flourish in the desert—and the disastrous consequences we face when any part of this tenuous system fails.

Title 10, Energy, Parts 500-End

The federal government owns roughly 640 million acres, about 28% of the 2.27 billion acres of land in the United States. Four agencies administer 608.9 million acres of this land: the Bureau of Land Management (BLM), Fish and Wildlife Service (FWS), and National Park Service (NPS) in the Department of the Interior (DOI), and the Forest Service (FS) in the Department of Agriculture. Most of these lands are in the West and Alaska. In addition, the Department of Defense administers 14.4 million acres in the United States consisting of military bases, training ranges, and more. Numerous other agencies administer the remaining federal acreage. The lands administered by the four land agencies are managed for many purposes, primarily related to preservation, recreation, and development of natural resources. Yet each of these agencies has distinct responsibilities. The BLM manages 247.3 million acres of public land and administers about 700 million acres of federal subsurface mineral estate throughout the nation. The BLM has a multiple-use, sustained-yield mandate that supports a variety of uses and programs, including energy development, recreation, grazing, wild horses and burros, and conservation. The FS manages 192.9 million acres also for multiple uses and sustained yields of various products and services, including timber harvesting, recreation, grazing, watershed protection, and fish and wildlife habitats. Most of the FS lands are designated national forests. Wildfire protection is increasingly important for both agencies. The FWS manages 89.1 million acres of the total, primarily to conserve and protect animals and plants. The National Wildlife Refuge System includes wildlife refuges, waterfowl production areas, and wildlife coordination units. The NPS manages 79.6 million acres in 401 diverse units to conserve lands and resources and make them available for public use. Activities that harvest or remove resources generally are prohibited. Federal land ownership is concentrated in the West. Specifically, 61.2% of Alaska is federally owned, as is 46.9% of the 11 coterminous western states. By contrast, the federal government owns 4.0% of lands in the other states. This western concentration has contributed to a higher degree of controversy over land ownership and use in that part of the country. Throughout America's history, federal land laws have reflected two visions: keeping some lands in federal ownership while disposing of others. From the earliest days, there has been conflict between these two visions. During the 19th century, many laws encouraged settlement of the West through federal land disposal. Mostly in the 20th century, emphasis shifted to retention of federal lands. Congress has provided varying land acquisition and disposal authorities to the agencies, ranging from restricted to broad. As a result of acquisitions and disposals, federal land ownership by the five agencies has declined by 23.5 million acres since 1990, from 646.9 million acres to 623.3 million acres. Much of the decline is attributable to BLM land disposals in Alaska and also reductions in DOD land. Numerous issues affecting federal land management are before Congress. They include the extent of federal ownership, and whether to decrease, maintain, or increase the amount of federal holdings; the condition of currently owned federal infrastructure and lands, and the priority of their maintenance versus new acquisitions; the optimal balance between land use and protection, and whether federal lands should be managed primarily to benefit the nation as a whole or instead to benefit the localities and states; and border control on federal lands along the southwest border.

John Fielder, Colorado's preeminent nature photographer, will publish his 50th Colorado book in fall, 2018. In the mold of

Colorado's best-selling book of all time, *Colorado 1870-2000*, Fielder has chosen to represent his state exclusively in black and white. He edited 230 color images from his life's work in Colorado over the past 40 years, and rendered each in blacks, whites, and subtle tones of gray. Without the distraction of color, the viewer engages the shapes, textures, lines, and edges of this most scenic of states as never before. Divided into eight chapters, Fielder spares no subject endemic to his adopted state. From dramatic mountain reflections and wildlife galore, to 19th century mine building facades and ancestral Puebloan ruins, nothing has been left out except the color! Fielder has written captions for each of the 230 images in the book.

Transport and sustainability are intrinsically linked. This book examines the links between transport, tourism, and sustainability by means of a series of large case studies covering several countries.

Wyoming's colorful story of water management illuminates the powerful forces that impact water use in the rural American West. The state's rich history of managing this valuable natural resource provides insights and lessons for the twenty-first-century American West as it faces drought and climate change. *Public Waters* shows how, as popular hopes and dreams meet tough terrain, a central idea that has historically structured water management can guide water policy for Western states today. Drawing on forty years as a journalist with training in water law and economics, Anne MacKinnon paints a lively picture of the arcane twists in the notable record of water law in Wyoming. She maintains that other Western states should examine how local people control water and that states must draw on historical understandings of water as a public resource to find effective approaches to essential water issues in the West.
